Gartner: Big Data Will Generate 6 Million U.S. Jobs by 2015

[Susan Hall](#) | [CHARTING YOUR IT CAREER](#) | 23 OCT, 2012

[Print](#) | [Email](#) | [Share](#) [f](#) [t](#) [+](#)

Gartner predicts that 4.4 million IT **jobs will be created to support Big Data** by 2015, with 1.9 million of them to be in the United States.

In addition, every Big Data-related role in the United States will create employment for three people outside of IT, pushing the total to 6 million U.S. jobs, Peter Sondergaard, senior vice president at Gartner and global head of research, told those attending the Gartner Symposium/ITxpo. He said:

But there is a challenge. There is **not enough talent** in the industry. Our public and private education systems are failing us. Therefore, only one-third of the IT jobs will be filled. Data experts will be a scarce, valuable commodity," he said. "IT leaders will need immediate focus on how their organization develops and attracts the skills required. These jobs will be needed to grow your business. These jobs are the future of the new information economy.

Though I don't follow Sondergaard's math, we know there's a **shortage of analytics talent for Big Data and for engineering talent as well.**

Big Data is characterized not only by the enormous volume or the velocity of its generation but also by the heterogeneity, diversity and complexity of the data.

Suzi Iacono, source: <http://community.topcoder.com/coeci/nitr/>

- **volume:** the sheer size of the data
- **velocity:** new data is added at breathtaking speed
- **variety:** different formats and different perspectives

Sometimes mentioned:

- **value:** how useful is the data?
- **veracity:** how good/reliable is the data?

however, these can also be subsumed under “variety”.

Variety can be handled with existing methods if volume and velocity are small.

Big Data research is primarily about methods for handling variety if volume and velocity are so high that existing methods fail.

Copernicus lunar crater located on earth – courtesy of Krzysztof Janowicz http://stko.geog.ucsb.edu/location_linked_data (missing reference coordinate system)

Copernicus (lunar crater)

You do not have permission to edit this page.

[View](#) [Revisions](#)

Copernicus is a [lunar impact crater](#) named after the astronomer [Nicolaus Copernicus](#), located in eastern [Oceanus Procellarum](#). It is estimated to be about 800 million years old, and typifies craters that formed during the [Copernican period](#) in that it has a prominent [ray system](#).

Contents

- [Names](#)
- [Satellite craters](#)
- [See also](#)
- [References](#)
- [External links](#)

Characteristics

Copernicus is visible using [binoculars](#), and is located slightly northwest of the center of the Moon's Earth-facing hemisphere. South of the crater is the [Mare Insularum](#), and to the south-south west is the crater [Reinhold](#). North of Copernicus are the [Montes Carpatus](#), which lie at the south edge of [Mare Imbrium](#). West of Copernicus is a group of dispersed lunar hills. Due to its relative youth, the crater has remained in a relatively pristine shape since it formed.

The circular rim has a discernible hexagonal form, with a [terraced](#) inner wall and a 30 km wide, sloping [rampart](#) that descends nearly a kilometer to the surrounding [mare](#). There are three distinct terraces visible, and arc-shaped [landslides](#) due to slumping of the inner wall as the crater debris subsided.

Most likely due to its recent formation, the crater floor has not been flooded

The **first person mentioned by name** in 'The Man in the Iron Mask' is this **hero** of a novel by the **same author**.

The DeepQA hypothesis is that by complementing classic knowledge-based approaches with recent advances in NLP, Information Retrieval, and Machine Learning to interpret and reason over huge volumes of widely accessible naturally encoded knowledge (or "unstructured knowledge") we can build effective and adaptable open-domain QA systems. While they may not be able to formally prove an answer is correct in purely logical terms, they can build confidence based on a combination of reasoning methods that operate directly on a combination of the raw natural language, automatically extracted entities, relations and available structured and semi-structured knowledge available from for example the **Semantic Web**.

Apple Buys Siri: Once Again The Back Story Is About

Semantic Web

by Bernard Lunn on April 26, 2010 2:35 PM

According to Robert Sooble who got it from tracking FTC, [Apple is buying Siri](#). (This has yet to be confirmed by Siri or Apple). The front story is mobile, specifically a bruising battle between Apple and Google. But once again the back story is semantic technology. Siri is not some cute iPhone app banged together in a garage over a Red Bull fueled long weekend. Siri has hard core semantic tech that originated from Darpa (just like that little system called the Internet).

Like the Facebook OpenGraph story, this is another example of semantic web going mainstream. The Open Graph front story was all about social media, but the back story was their adoption of RDFa. That has been a big boost to the semantic web community.

Siri looks like a good exit for investors and will give them confidence to invest more in companies

Open Graph Protocol

[Getting Started](#) > [Open Graph Protocol](#)

We announced the next version of the Open Graph at f8 2011. It is currently released to the public. You can view the Open Graph documentation [here](#). The below documentation refers to the first version of the Open Graph that shipped with the [Like Button](#) at f8 2010.

We have also updated how the Like Button will function with respect to the next version of Open Graph. Please read the following developer doc about the [Like Button Migration](#).

The Open Graph Protocol enables you to integrate your Web pages into the social graph. It is currently designed for Web pages representing profiles of real-world things — things like movies, sports teams, celebrities, and restaurants. Including Open Graph tags on your Web page, makes your page equivalent to a [Facebook Page](#). This means when a user clicks a [Like button](#) on your page, a connection is made between your page and the user. Your page will appear in the "Likes and Interests" section of the user's profile, and you have the ability to publish updates to the user. Your page will show up in the same places that Facebook pages show up around the site (e.g. search), and you can target ads to people who like your content. The structured data you provide via the Open Graph Protocol defines how your page will be represented on Facebook.

- **Big Data**
- **Semantic Web**
- **EarthCube**

NSF effort for the earth sciences

Goal:

To transform the conduct of research in the geosciences by developing IT solutions for the integration of information and data in the geosciences.

How this is going to be done is still in the making.

Semantic Technologies have been part of the mix from the start.

[Berg-Cross, ..., Hitzler et al., GIBDa 2012]

EarthCube requires

- information integration
- interoperability
- conceptual modeling
- intelligent search
- data-model intercomparison
- data publishing support

Semantic Web studies

- information integration
- interoperability
- conceptual modeling
- intelligent search
- data-model intercomparison
- data publishing support

[Joshi, Jain, Hitzler et al. ODBASE 2012]

$a:\text{flowsInto} \sqsubseteq a:\text{IsConnected}$ (1)

$a:\text{IrrigationCanal} \sqsubseteq a:\text{Canal}$ (2)

$\exists a:\text{flowsInto}.a:\text{AgriculturalField} \sqsubseteq a:\text{IrrigationCanal}$ (3)

$a:\text{Waterbody} \sqcap a:\text{Land} \sqsubseteq \perp$ (4)

$a:\text{AgriculturalField} \sqsubseteq a:\text{Land}$ (5)

$b:\text{flowsInto} \sqsubseteq b:\text{IsConnected}$ (6)

$b:\text{Canal} \sqsubseteq (\geq 2 b:\text{IsConnected}.b:\text{Waterbody})$ (7)

$b:\text{IrrigationCanal} \equiv (=1 b:\text{IsConnected}.b:\text{Waterbody})$

$\sqcap (=1 b:\text{flowsInto}.b:\text{AgriculturalField})$ (8)

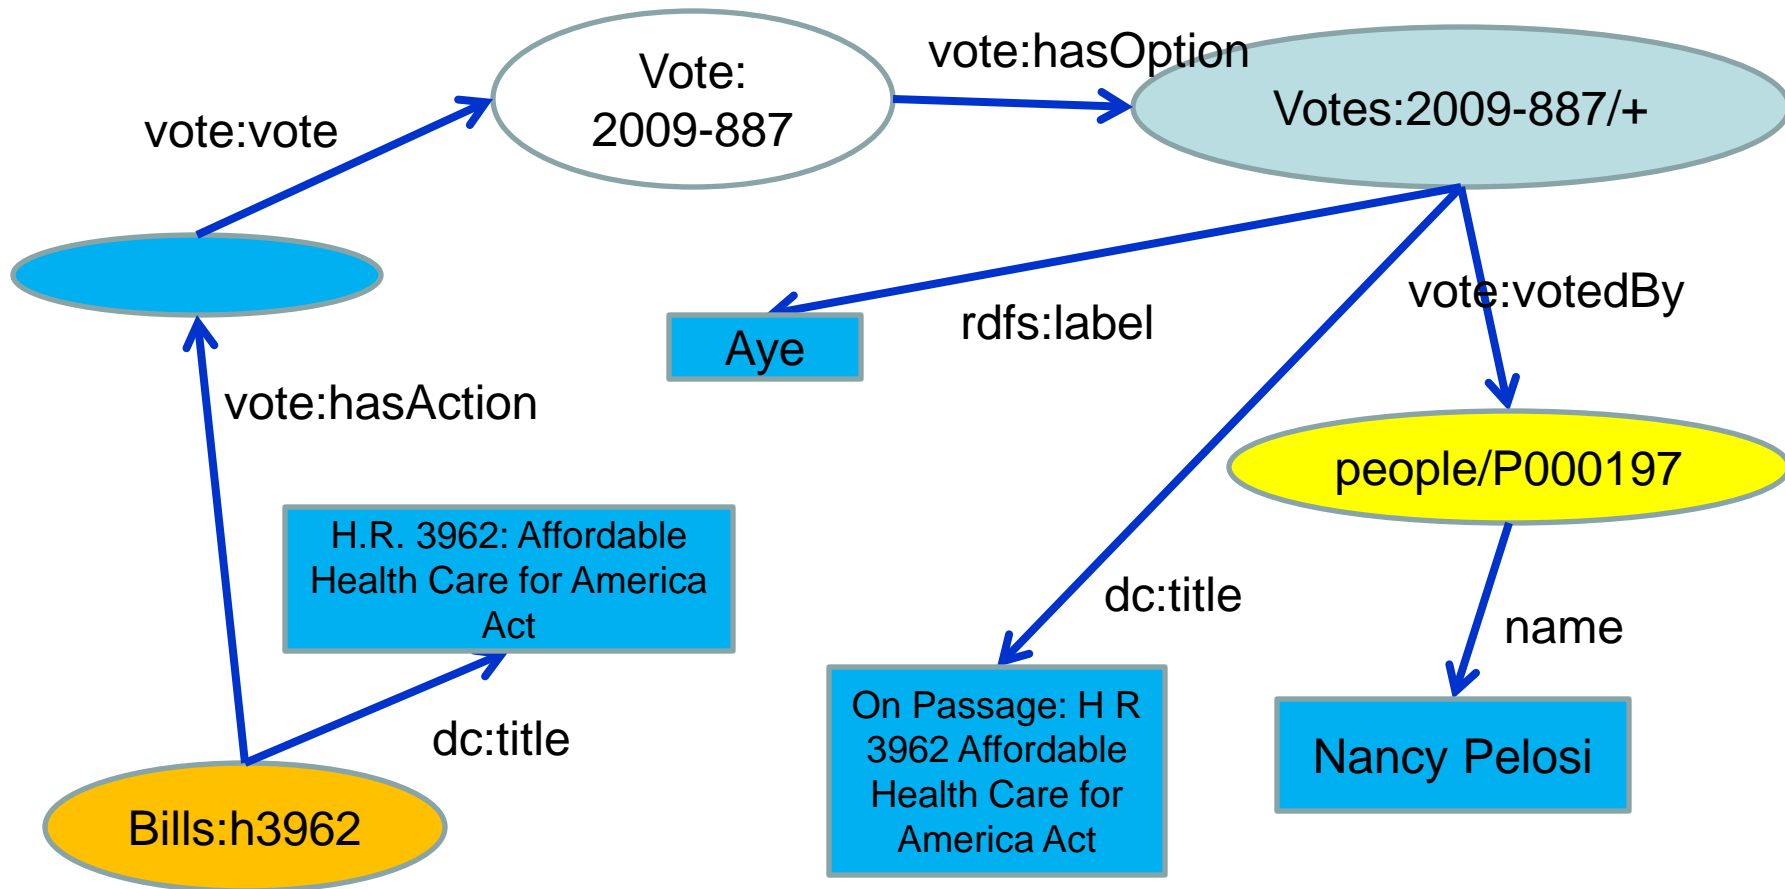

Two ontologies.

Left: transportation domain

Right: agriculture domain

We cannot simply equate $a:\text{Canal}$ and $b:\text{Canal}$!

“Nancy Pelosi voted in favor of the Health Care Bill.”

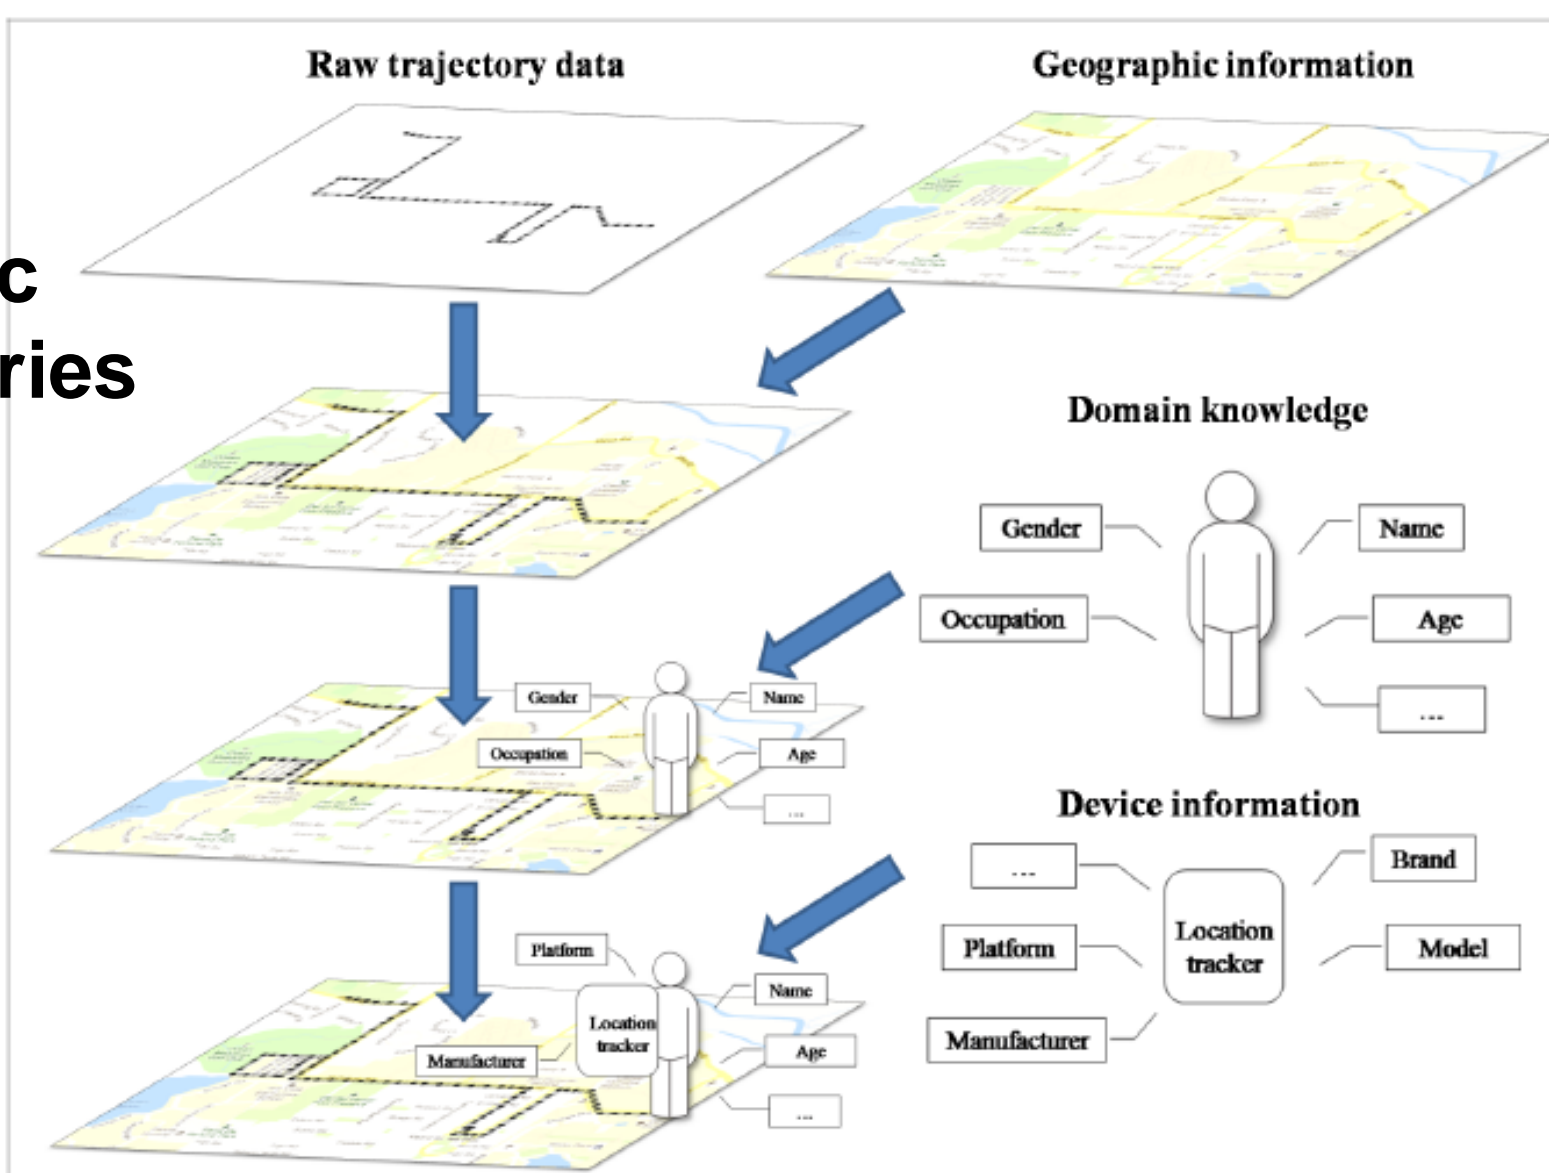

- **Bottom-up homogeneization of data representation.**
- **Avoidance of strong ontological commitments.**
- **Avoidance of standardization.**
- **Well thought-out patterns can be very strong and versatile, thus serve many needs.**

We are currently establishing many geo-patterns in a series of hands-on workshops, the GeoVoCamps, see <http://vocamp.org/>

“Horizontal” alignment via patterns

Semantic Trajectories

$$\top \sqsubseteq \leq 1 hasUpperBound.\top \quad (17)$$

$$\top \sqsubseteq \leq 1 isPresentedAs.\top \quad (18)$$

$$\top \sqsubseteq \leq 1 isScaled.\top \quad (19)$$

$$\top \sqsubseteq \leq 1 representsObject.\top \quad (20)$$

$$ScaledRep \sqsubseteq \exists isPresentedAs.GeometricRep \quad (21)$$

$$ScaledRep \sqsubseteq \exists isScaled.ScaleLevel \quad (22)$$

$$ScaledRep \sqsubseteq \exists representsObject.GeographicThing \quad (23)$$

$$isConstituentOf^- \circ representsObject \circ representsObject^- \sqsubseteq R_{aux} \quad (24)$$

$$\top \sqsubseteq \leq 1 (R_{aux} \sqcap isConstituentOf^-).\top \quad (25)$$

$sharesApplicationWith(m_x, m_y) \wedge hasScale(s_y, m_y) \wedge hasScale(s_x, m_x)$
 $\wedge isLargerThan(s_x, s_y) \wedge$
 $isConstituentOf(m_x, sr_x) \wedge isConstituentOf(m_y, sr_y) \wedge$
 $representsObject(sr_x, g) \wedge representsObject(sr_y, g) \wedge$
 $isPresentedAs(sr_x, grr_x) \wedge isPresentedAs(sr_y, grr_y) \wedge$
 $isMoreGeneralThan(grr_x, grr_y) \rightarrow \perp(m_x)$

This rule enforces that the ontology becomes inconsistent if

- there exist maps m_1 and m_2 belonging to the same application with scales s_1 and s_2 ,
- scale s_1 is larger than scale s_2 ,
- maps m_1 and m_2 contain scaled representations sr_1 and sr_2 that represent the same geographic thing g , and
- the geographic representation record grr_1 for sr_1 is more general than the one for sr_2 , namely grr_2 .

$sharesApplicationWith(m_x, m_y) \wedge hasScale(s_y, m_y) \wedge hasScale(s_x, m_x)$
 $\wedge isLargerThan(s_x, s_y) \wedge$
 $isConstituentOf(m_x, sr_x) \wedge isConstituentOf(m_y, sr_y) \wedge$
 $representsObject(sr_x, g) \wedge representsObject(sr_y, g) \wedge$
 $isPresentedAs(sr_x, grr_x) \wedge isPresentedAs(sr_y, grr_y) \wedge$
 $isMoreGeneralThan(grr_x, grr_y) \rightarrow \perp(m_x)$

$hasScale^- \circ sharesApplicationWith \circ hasScale \sqsubseteq R_1$

$R_1 \sqcap isLargerThan \sqsubseteq R_2$

$isScaled \circ R_2 \circ isScaled \sqsubseteq R_3$

$isPresentedAs \circ isMoreGeneralThan^- \circ isPresentedAs^- \sqsubseteq R_4$

$representsObject \circ representsObject^- \sqsubseteq R_5$

$R_3 \sqcap R_4 \sqcap R_5 \sqsubseteq R_\perp$

$\exists R_\perp.T \sqsubseteq \perp$
